ABSTRACT

A transformation semigroup is a pair $\langle Q, S \rangle$ consisting of a finite set $Q$, a finite semigroup $S$ and a semigroup action $\lambda : Q \times S \rightarrow Q, (q, s) \mapsto s(q)$ which means:

(i) $\forall q \in Q, s, t \in S : st(q) = s(t(q))$,

(ii) $\forall s, t \in S, \forall q \in Q, s(q) = t(q) \Rightarrow s = t$.

A state machine or a semiautomation is an ordered triple $M = (Q, \Sigma, F)$, where $Q$ and $\Sigma$ are finite sets and $F : Q \times \Sigma \rightarrow Q$ is a partial function. In this paper, we give the construction of state machines associate a direct product, the cascade product and wreath product of transformations semigroups.

Keywords: semigroup, semigroup action, morphism semigroup, transformation semigroup, state machine.

1. INTRODUCTION

Actions of semigroups are important both in mathematics and computer science. The theory of machines developed so far has largely influenced the development of computer science and associated language. The theory of machines that has developed in last twenty years, has had a considerable influence, not only on the computer systems, but also biology, biochemistry, etc.

The remainder of this paper is organized as follows. In Section 2, we begin with some elementary material concerning of transformation semigroups and state machines. In Section 3, we give the construction of state machines associate a direct product of transformations semigroups. In Section 4, we give the construction of state machines associate with the cascade product of transformations semigroups. In Section 5, we give the construction of state machines associate with the wreath product of transformations semigroups. Finally, we draw our conclusions in Section 6.

2. PRELIMINARIES

A semigroup is an ordered pair $\langle S, \cdot \rangle$, where $S$ is a nonempty set and the dot is an associative binary operation, i.e., a function $(s_1, s_2) \rightarrow s_1 \cdot s_2$ from $S \times S$ into $S$ such that for all $s_1, s_2, s_3$, $(s_1 \cdot s_2) \cdot s_3 = s_1 \cdot (s_2 \cdot s_3)$. $(S, \cdot)$ will usually be abbreviated to $S$ and $s_1 \cdot s_2$ to $s_1 s_2$. A semigroup $S$ is commutative or abelian if $s_1 s_2 = s_2 s_1$.

A finite transformation semigroup is a pair $X = (Q, S)$, where $Q$ is a finite set, and $S$ is a set of
functions from Q into itself that forms a semigroup under composition. If S contains the identity mapping on Q then we say that X is a transformation monoid. If X = (Q, S), then X denotes the transformation semigroup that results by adjoining to S all the constant mappings on Q.

If S is a monoid, i.e., if S has an identify 1, then the semigroup action λ : Q X S → Q is further assumed to satisfy 1(q) = q, for each q ∈ Q.

We formally define an alphabet as a non-empty finite set. A word over an alphabet is a finite sequence of symbols of Σ. Although one writes a sequence as (σ₁, σ₂, ..., σₙ), in the present context, we prefer to write it as σ₁ σ₂ ... σₙ. The set of all words on the alphabet Σ is denoted by Σ* and is equipped with the associative operation defined by the concatenation of two sequences. The concatenation of two sequences α₁ α₂ ... αₙ and β₁ β₂ ... βₘ is the sequence α₁ α₂ ... αₙβ₁ β₂ ... βₘ.

The concatenation is an associative operation. The string consisting of zero letters is called the empty word, written ε. Thus, ε, α, β, ααβα, αααβα are words over the alphabet {α, β}. Thus the set Σ* of words is equipped with the structure of a monoid. The monoid Σ* is called the free monoid on Σ. The length of a word w, denoted |w|, is the number of letters in w when each letter is counted as many times as it occurs. Again by definition, |ε| = 0. For example |ααβα| = 4 and |αααβα| = 5. Let w be a word over an alphabet Σ. For σ ∈ Σ, the number of occurrences of in w shall be denoted by |w|σ. For example |ααβα|α = 1 and |αααβα|α = 4.

A state machine or a semi-automation is an ordered triple M = (Q, Σ, F), where Q and Σ are finite sets and F : Q X Σ → Q is a partial function. A state machine M = (Q, Σ, F) is said to complete if F : Q X Σ → Q is a function.

Corresponding to a transformation semigroup X = (Q, S), there is a state machine M = (Q, S, F), where F : Q X S → Q is defined by F(q, s) = s(q), for each q ∈ Q and for each s ∈ S. M is called the state machine of X, denoted by M(X).

For every transformation semigroup X = (Q, S), there is a morphism Σ : S → E(Q), the semigroup of all mappings f : Q → Q, given by Σ(s) = f, where f(q) = s(q). E(Q) is usually called the full transformation semigroup on Q.

Let M = (Q, Σ, F) and M' = (Q', Σ', F') be state machines. A pair of mappings (δ, θ) : M → M' is said to be a state machine homomorphism iff δ : Q → Q' and θ : Σ' is a pair of mappings such that δoFσ = F'θ(σ) oδ, ∀σ ∈ Σ, where Fσ : Q → Q is defined by Fσ(q) = F(q, σ), ∀q ∈ Q. A state machine homomorphism (δ, θ) : M → M' is said to be:

(i) a monomorphism if δ and θ are both injective;
(ii) an epimorphism if δ and θ are both surjective;
(iii) an isomorphism if δ and θ is both a monomorphism and an epimorphism (written M ≅ M')

Let M₁ = (Q₁, Σ₁, F₁) and M₂ = (Q₂, Σ₂, F₂) be state machines. Suppose that M₁ and M₂ are state machines with the same input Σ. Connecting them up in this way, will produce a new state machine M₁ X M₂ = (Q₁ X Q₂, Σ₁ X Σ₂, F₁ X F₂), where (F₁ X F₂)(((q₁, q₂), σ) = (F₁(q₁, σ), F₂(q₂, σ)) for σ Note: Accepted manuscripts are articles that have been peer-reviewed and accepted for publication by the Editorial Board. These articles have not yet been copyedited and/or formatted in the journal house style.
Let $M_1 = (Q_1, \Sigma_1, F_1)$ and $M_2 = (Q_2, \Sigma_2, F_2)$ be state machines. We define $M_1 \times M_2 = (Q_1 \times Q_2, \Sigma_1 \times \Sigma_2, F_1 \times F_2)$ where $(F_1 \times F_2)((q_1, q_2), (\sigma_1, \sigma_2)) = (F_1(q_1, \sigma_1), F_2(q_2, \sigma_2))$ for $(\sigma_1, \sigma_2) \in \Sigma_1 \times \Sigma_2$. We call this state machine the restricted direct product of $M_1$ and $M_2$.

Let $M_1 = (Q_1, \Sigma_1, F_1)$ and $M_2 = (Q_2, \Sigma_2, F_2)$ be state machines. We define the cascade product of $M_1$ and $M_2$ with respect to $w$: $Q_2 \times \Sigma_2 \rightarrow \Sigma_1$ by $M_1 \circ M_2 = (Q_1 \times Q_2, \Sigma_1 \times \Sigma_2, F^w)$ where $F_w((q_1, q_2), \sigma_2) = (F_1(q_1, w(q_2, \sigma_2)), F_2(q_2, \sigma_2))$ for $\sigma_2 \in \Sigma_2$, $q \in Q_1$, $q_2 \in Q_2$.

Let $M_1 = (Q_1, \Sigma_1, F_1)$ and $M_2 = (Q_2, \Sigma_2, F_2)$ be state machines. We define the wreath product of $M_1$ and $M_2$ by $M_1 \triangleright M_2 = (Q_1 \times Q_2, \Sigma_1 \times \Sigma_2, F_w)$ where $F_w((q_1, q_2), (f, \sigma_2)) = (F_1(q_1, f(q_2)), F_2(q_2, \sigma_2))$ for $\sigma_2 \in \Sigma_2$, $f \in F$, $(q_1, q_2) \in Q_1 \times Q_2$.

3. DIRECT PRODUCT OF TRANSFORMATION SEMIGROUP AND STATE

In this section, we give the construction of state machines associate a direct product of transformations semigroups.

**Proposition 1** Let $X = (Q, S)$ and $Y = (P, T)$ be transformation semigroups.

1. The direct product of $X$ and $Y$, written $X \times Y$, is defined as a transformation semigroup $X \times Y = (Q \times P, S \times T)$.
2. If $X = (Q, S)$, $Y = (P, T)$ and $Z = (R, V)$ are transformation semigroup then $(S \times T) \times V \equiv S \times (T \times V)$.
3. $M(X \times Y) = M(X) \times M(Y)$. 

**Proof.**

1. The element of $S \times T$ being the ordered pairs $(s, t)$, $s \in S$, $t \in T$ with $(s, t)(q, p) = (s(q), t(p))$, for each $q \in Q$, $p \in P$.
2. The mapping $((s, t), v) \mapsto (s, (t, v))$ is an isomorphism of $(S \times T) \times V$ and $S \times (T \times V)$.
3. We have $M(X) = (Q, S, F_X)$, where $F_X : Q \times S \rightarrow Q$ is defined by $F_X(q, s) = s(q)$, for all $s \in S$, $q \in Q$. Also we have $M(Y) = (P, T, F_Y)$, where $F_Y : P \times T \rightarrow P$ is defined by $F_Y(p, t) = t(p)$, for all $t \in T$, $p \in P$. A similar argument, we have $M(X \times Y) = (Q \times P, S \times T, F_{X \times Y})$, where $F_{X \times Y} : (Q \times P) \rightarrow (S \times T)$ is defined by $F_{X \times Y}((q, p), (s, t)) = (s(q), t(p))$, for all $(s, t) \in S \times T$, $(q, p) \in Q \times P$. Consequently $M(X \times Y) = M(X) \times M(Y)$. 

**Example 2** Consider the transformation semigroup $X = (Q, S)$, where $Q = \{0, 1\}$, $S = \langle s \rangle$, $s$ defined by $s(0) = 1$, $s(1) = 0$, we have $S = \{s, s^2\}$ with $s^2(0) = 0$, $s^2(1) = 1$ and the identity $s^3 = s$. $M(X) = (Q, S, F_X)$ the state machine of $X$ is given by the following table:

<table>
<thead>
<tr>
<th>$F_X$</th>
<th>$s$</th>
<th>$s^2$</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>1</td>
<td>0</td>
</tr>
</tbody>
</table>

Note: Accepted manuscripts are articles that have been peer-reviewed and accepted for publication by the Editorial Board. These articles have not yet been copyedited and/or formatted in the journal house style.
Let $Y = (P, T)$ be transformation semigroup, where $P = \{0, 1\}$, $T = \langle t \rangle$, $t$ defined by $t (0) = 1$, $t (1) = 1$. We have $T = \{t\}$, and $M(Y) = (P, T, F_Y)$ the state machine of $Y$ is given by the following table:

<table>
<thead>
<tr>
<th>$F_Y$</th>
<th>$T$</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>1</td>
</tr>
<tr>
<td>1</td>
<td>1</td>
</tr>
</tbody>
</table>

Consequently $M (X \times Y) = (Q \times P, S \times T, F_{X \times Y})$ the state machine of $X \times Y$ is given by the following table:

<table>
<thead>
<tr>
<th>$F_{X \times Y}$</th>
<th>$(s, t)$</th>
<th>$(s^2, t)$</th>
</tr>
</thead>
<tbody>
<tr>
<td>$(0,0)$</td>
<td>$(1,1)$</td>
<td>$(0,1)$</td>
</tr>
<tr>
<td>$(0,1)$</td>
<td>$(1,1)$</td>
<td>$(0,1)$</td>
</tr>
<tr>
<td>$(1,0)$</td>
<td>$(0,1)$</td>
<td>$(1,1)$</td>
</tr>
<tr>
<td>$(1,1)$</td>
<td>$(0,1)$</td>
<td>$(1,1)$</td>
</tr>
</tbody>
</table>

4. **CASCADE PRODUCT OF TRANSFORMATION SEMIGROUP AND STATE MACHINE**

In this section, we give the construction of state machines associate a the cascade product of transformations semigroups.

**Proposition 3** Given any transformation semigroup $X = (Q, S)$ and $Y = (P, T)$, suppose that $w : P \times T \rightarrow S$ is a mapping. Then

1. The transformation semigroup $X \times Y = (Q \times P, Tw)$ is called the cascade product of $X$ and $Y$ with respect to $w$, on $Q \times P$ with $Tw = \{t_w : Q \times P \rightarrow Q \times P, t_w (q, p) = (w (p, t) (q), t (p))\}$ for all $t \in T$, $(q, p) \in Q \times P$.
2. The state machine $M (X \times Y)$ is the cascade product of $M (X)$ and $M (Y)$, i.e., $M (X \times Y) = M (X) \times M (Y)$.

**Proof.**

1. Since $T_w$ is a set of functions from $Q \times P$ into itself, then $X \times Y = (Q \times P, T_w)$ is transformation semigroup.

2. We have $M (X) = (Q, S, F_X)$, where $F_X : Q \times S \rightarrow Q$ is defined by $F_X (q, s) = s (q)$, for all $s \in S$, $q \in Q$. Also we have $M (Y) = (P, T, F_Y)$, where $F_Y : P \times T \rightarrow P$ is defined by $F_Y (p, t) = t (p)$, for all $t \in T$, $p \in P$. A similar argument, we have $M (X \times Y) = (Q \times P, Tw, F_{X \times Y})$, where $F_{X \times Y}$:

Note: Accepted manuscripts are articles that have been peer-reviewed and accepted for publication by the Editorial Board. These articles have not yet been copyedited and/or formatted in the journal house style.
(Q X P) Tw → Q X P is defined by $F_X X_{w Y} ((q, p), t_w) = (w(p, t)(q), t(p))$, for all $t_w \in T_w$, $(q, p) \in Q X P$. Consequently $M(X X_{w Y}) = M(X) X_{w} M(Y)$. 

**Example 4** Consider the transformation semigroup $X = (Q, S)$, where $Q = \{0, 1\}$, $S = \langle s \rangle$, $s$ defined by $s(0) = 1$, $s(1) = 0$, we have $S = \{s, s^2\}$ with $s^2(0) = 0$, $s^2(1) = 1$ and the identity $s^3 = s$. $M(X) = (Q, S, F_X)$ the state machine of $X$ is given by the following table:

<table>
<thead>
<tr>
<th>$F_X$</th>
<th>$S$</th>
<th>$S^2$</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>1</td>
<td>0</td>
</tr>
<tr>
<td>1</td>
<td>0</td>
<td>1</td>
</tr>
</tbody>
</table>

Let $Y = (P, T)$ be transformation semigroup, where $P = \{0, 1\}$, $T = \langle t \rangle$ defined by $t(0) = 1$, $t(1) = 1$. We have $T = \{t\}$, and $M(Y) = (P, T, F_Y)$ the state machine of $Y$ is given by the following table:

<table>
<thead>
<tr>
<th>$F_X X_{w Y}$</th>
<th>$t_w$</th>
</tr>
</thead>
<tbody>
<tr>
<td>(0, 0)</td>
<td>(1, 1)</td>
</tr>
<tr>
<td>(0, 1)</td>
<td>(0, 1)</td>
</tr>
<tr>
<td>(1, 0)</td>
<td>(0, 1)</td>
</tr>
<tr>
<td>(1, 1)</td>
<td>(1, 1)</td>
</tr>
</tbody>
</table>

Define the mapping $w : P X T \rightarrow S$ by $w(o, t) = s$, $w(1, t) = s^2$. We have $X X_{w Y} = (Q X P, T_w)$, where $t_w : Q X P \rightarrow Q X P$, $t_w(q, p) = (w(p, t)(q), t(p))$ for all $t \in T$ and $(q, p) \in Q X P$. Since $T = \{t\}$, then $T_w = \{t_w\}$ where,

$t_w(0, 0) = (w(0, t)(0), t(0)) = (s(0), 1) = (1, 1);$

$t_w(0, 1) = (w(1, t)(0), t(1)) = (s^2(0), 1) = (0, 1);$

$t_w(1, 0) = (w(0, t)(0), t(0)) = (s(1), 1) = (0, 1);$

$t_w(1, 1) = (w(1, t)(1), t(1)) = (s^2(1), 1) = (1, 1).$

$M(X X_{w Y}) = (Q X P, T_w, F_X X_{w Y})$ the state machine of $X X_{w Y}$ is given by the following table:

<table>
<thead>
<tr>
<th>$F_Y$</th>
<th>$t$</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>1</td>
</tr>
<tr>
<td>1</td>
<td>1</td>
</tr>
</tbody>
</table>

5. **WREATH PRODUCT OF TRANSFORMATION SEMIGROUP AND STATE MACHINE**

In this section, we give the construction of state machines associate with the cascade product of transformations semigroups.

**Proposition 5** Let $X = (Q, S)$ and $Y = (P, T)$ be transformation semigroups. Let $S^P$ the set of all mappings $f : P \rightarrow S$. Then

1. The transformation semigroup $X_w Y = (Q X P, S^P X T)$ is called the wreath product of $X$ and $Y$. 

Note: Accepted manuscripts are articles that have been peer-reviewed and accepted for publication by the Editorial Board. These articles have not yet been copyedited and/or formatted in the journal house style.
The state machine $M(X_wY)$ is the wreath product of $M(X)$, and $M(Y)$, i.e., $M(X_wY) = M(X) \ast M(Y)$.

**Proof.**

1. We show that $S^p X T$ is closed under composition. Let $(f_1, t_1), (f_2, t_2) \in S^p X T$, i.e., for all $(q, p) \in Q \times P$, $(f_1, t_1)(q, p) = (f_1(p)(q), t_1(p))$ and $(f_2, t_2)(q, p) = (f_2(p)(q), t_2(p))$. We have $(f_1, t_1) \circ (f_2, t_2)(q, p) = (f_1(t_1((f_2(p)(q), t_2(p)))) = (f_1(t_2(p)(f_2(p)(q))))$, for all $(q, p) \in Q \times P$.

2. We have $M(X) = (Q, S, F_X)$, where $F_X : Q \times S \rightarrow Q$ is defined by $F_X(q, s) = s(q)$, for all $s \in S$, $q \in Q$. Also we have $M(Y) = (P, T, F_Y)$, where $F_Y : P \times T \rightarrow P$ is defined by $F_Y(p, t) = t(p)$, for all $t \in T$, $p \in P$. A similar argument, we have $M(X_wY) = (Q \times P, S^p X T, F_{X_wY})$, where $F_{X_wY} : (Q \times P) \times S^p X T \rightarrow Q \times P$ is defined by $F_{X_wY}((q, p), (f, t)) = (f(p)(q), t(p))$, for all $(f, t) \in S^p X T$, $(q, p) \in Q \times P$. Consequently $M(X_wY) = M(X) \ast M(Y)$.

**Example 6** Consider the transformation semigroup $X = (Q, S)$, where $Q = \{0, 1\}$, $S = \langle s \rangle$, $s$ defined by $s(0) = 1$, $s(1) = 0$, we have $S = \{s, s^2\}$ with $s^2(0) = 0$, $s^2(1) = 1$ and the identity $s^3 = s$. $M(X) = (Q, S, F_X)$ the state machine of $X$ is given by the following table:

<table>
<thead>
<tr>
<th></th>
<th>$F_X$</th>
<th>$S$</th>
<th>$S^2$</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>0</td>
<td>1</td>
<td>0</td>
</tr>
<tr>
<td>1</td>
<td>1</td>
<td>0</td>
<td>1</td>
</tr>
</tbody>
</table>

Let $Y = (P, T)$ be transformation semigroup, where $P = \{0, 1\}$, $T = \langle t \rangle$, $t$ defined by $t(0) = 1$, $t(1) = 1$. We have $T = \{t\}$, and $M(Y) = (P, T, F_Y)$, the state machine of $Y$ is given by the following table:

<table>
<thead>
<tr>
<th></th>
<th>$F_Y$</th>
<th>$T$</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>0</td>
<td>1</td>
</tr>
<tr>
<td>1</td>
<td>1</td>
<td></td>
</tr>
</tbody>
</table>

We have $P = \{0, 1\}$ and $S = \{s, s^2\}$, then $S^p = \{f_i : \{0, 1\} \rightarrow \{s, s^2\}, 1 \leq i \leq 4\}$, where $f_1(0) = s$, $f_1(1) = s$; $f_2(0) = s$, $f_2(1) = s^2$; $f_3(0) = s^2$, $f_3(1) = s$; $f_4(0) = s^2$, $f_4(1) = s^2$. We have $T = \{t\}$, then $S^p X T = \{(f_1, t), (f_2, t), (f_3, t), (f_4, t)\}$.

$X_wY = (Q \times P, S^p X T)$, where

\[
\begin{align*}
(f_1, t)(0, 0) &= (f_1(0)(0), t(0)) = (s(0), t(0)) = (1, 1) \\
(f_1, t)(0, 1) &= (f_1(1)(0), t(1)) = (s(0), t(1)) = (1, 1) \\
(f_1, t)(1, 0) &= (f_1(0)(1), t(0)) = (s(1), t(0)) = (0, 1) \\
(f_1, t)(1, 1) &= (f_1(1)(1), t(1)) = (s(1), t(1)) = (0, 1) \\
(f_2, t)(0, 0) &= (f_2(0)(0), t(0)) = (s(0), t(0)) = (1, 1) \\
(f_2, t)(1, 0) &= (f_2(1)(0), t(0)) = (s(0), t(0)) = (1, 1) \\
(f_2, t)(0, 1) &= (f_2(0)(1), t(0)) = (s(0), t(0)) = (1, 1) \\
(f_2, t)(1, 1) &= (f_2(1)(1), t(0)) = (s(1), t(0)) = (0, 1)
\end{align*}
\]

Note: Accepted manuscripts are articles that have been peer-reviewed and accepted for publication by the Editorial Board. These articles have not yet been copyedited and/or formatted in the journal house style.

6. CONCLUSION

In this paper, we give the construction of state machines associate with the direct product of transformation semigroups, the cascade product of transformation semigroups and the wreath product of transformation semigroups, illustrated by some examples.
